

## The milking magic happens on a dairy farm

Cows produce milk, as we all know. Some of us even believe that chocolate milk is produced by brown cows. All jokes aside, how do the milk get from cows to our table? “That was simple!” you exclaim. “When you squeeze the udder, milk comes out!” says you. While this is true, the days of dairy farmers standing on a stool and milking cows one by one are long gone. This was a time-consuming but rewarding task, and dairy farmers now have new technology to help feed the world’s growing population! These days, more efficient machines and, in certain cases, robots relieve the strain on farmers’ hands all over the country.

**100-19 MOTOR SICH (115V)  
ELECTRIC CREAM SEPARATOR**

**\$349.00**

Different [Electric milking machine for cows](#) is used by dairy producers depending on the number of cows they milk, how often they milk, the cost of the machinery, and their personal preferences. It’s not just the technology that’s changed; the way dairies are built has also evolved since the days when each farmer had only one cow. The place where the milking magic happens on a dairy farm is known as a “parlour.” Like cows, milking parlours come in a variety of forms and sizes. Farmers put a lot of time and care into the design of this room, which is more about usefulness than feng shui. The comfort of the cows and farm workers is prioritised in the construction of parlours.

Single Cow Milker TJK1-PS (2 handles) 6 Gal Bucket

\$1,295.00

Mitty Supply is a company that sells portable milking equipment to small to medium-sized dairy farms at quite low prices. A portable milking machine is a simple device for extracting milk from animals. It is most commonly used on cows. For detail visit our website at <https://mittysupply.com/>.
